                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC Oligonucleotide probes that hybridise to the cDNA sequence are useful for CC analysing the expression of FCHL1 by detecting the expression of the mRNA CC transcript in the sample. A host cell transformed with the cDNA of the clintention is useful for producing the protein by recombinant means. CC pharmaceutical compositions based on the sequences of the invention are useful for treating or preventing a lipid disorder associated with CC expression of FCHL1 such as familial combined hyperlipidaemia, coronary CC artery disease, atherogenic lipoprotein phenotype, CC artery disease, atherogenic lipoprotein phenotype, CC dyslipidaemia, hypertriglyceridaemia, familial CC dyslipidaemia The CDNA sequence is useful in the diagnosis or CC prognosis of predisposition to lipid disorders and cancers, and also to CC identify a molecule which enhances or decreases the HYPLIP1 or FCHL1 CC activity. The present sequence represents an oligonucleotide primer CC specific for the mouse HYPLIP1 locus of the invention. The mouse HYPLIP1 or Specific for the mouse HYPLIP1 locus of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches

                The invention relates to antisense oligonucleotides of at least 10 complementary to inducible human phosphofructokinase-2 (1PFK-2) cleantisense oligonucleotides can be included in anticancer or antiinflammatory pharmaceutical compositions along with an oligonucleotide carrier. An iPFK-2 antagonist such as an enzymatic inhibitor, anti-IPFK-2 antibody, or iPFK-2 antisense molecule can administered for treating inflammatory disease or rapidly-growing cancers. The present sequence represents an iPFK-2-specific sense
  cancers. The present oligonucleotide

The inhibition of Fas mediated signalling is thought to be immunosuppressive, antiinflammatory, hepatotropic, cytostatic and vasotropic. Antisense oligonucleotides were designed to target human Fas. Oligonucleotides were synthesised as chimeric oligonucleotides and are useful for treating an animal having a autoimmune or inflammatory disease e.g., hepatitis, cancer, a condition associated with apoptosis, allograft rejection, or ischemia reperfusion injury. Optionally, the above mentioned conditions are prevented by contacting the allograft with the antisense oligonucleotide. The
                                                                                                                                                                                                                                                                 Example
                                                                                                                                                                                                                                                                                                                   phosphofructokinase-2.
                                                                                                                                                                                                                                                                                                                                      Novel antisense oligonucleotides useful for treating inflammatory diseases or cancers, comprises complementary sequence of inducible
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         US6413939-B1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Synthetic

                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to antisense oligonucleotides of at least 10 bas complementary to inducible human phosphofructokinase-2 (1PFK-2) cDNA. antisense oligonucleotides can be included in anticancer or antiinflammatory pharmaceutical compositions along with an oligonucleotide carrier. An iPFK-2 antagonist such as an enzymatic inhibitor, anti-iPFK-2 antibody, or iPFK-2 antisense molecule can be administered for treating inflammatory disease or rapidly-growing cancers. The present sequence represents an iPFK-2-specific antisense oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ABQ79631 standard; DNA; 20 BP

                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the characteristics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PCR primers for human chromosome 1\hat{p}36-35 DNA, and ABL45323 to ABL45634 represent PCR primers for human chromosome 21q22.1, which are specifically claimed for use in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Arraying genome clones
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WPI; 2002-144136/19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         10-MAR-2000; 2000JP-00066716.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a method of arraying genome clones. The CC method comprises: (a) clones of the genomic libraries contained in CC multiwell plates numbered for discrimination are mixed in each of the CC multiwell plates; (b) a primer designed based on the chromosome marker CC sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant CC amplified product to specify the discrimination Nos. of the multiwell CC plates containing the clones having said marker sequence; (d) the order CC of the markers is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to the multiwell plates; (e) the clones in the multiwell plates of the specified CC discrimination Nos. are mixed respectively in each wells of longitudinal CC and lateral directions; (f) the mixed clones are cultured and the CC are detected from the amplified by using the above primer; (g) signals CC are detected from the detected result; and (i) the clones are constituted as the positions on the chromosome and arrayed. The CC microarray is useful for gene analysis. ABL4957 to ABL45322 represent CC PCR primers for human chromosome 21922.1, which are Specifically claimed for use in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   invention may also be used to delay infection, inflammation and tumour formation. The present DNA sequence represents a human helicase-moi gene antisense oligonucleotide of the invention. NOTE: The present DNA sequence has a phosphorothicate backbone, bases 1-5 and 16-20 are 2'-methoxyethyl (2'-MOE) nucleotides

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC expanding a culture of undifferentiated embryonic steem (ES) cells, CC generating embryoid bodies (EB), culturing the bodies to select for CC central nervous system (CNS) precursor cells (PC), culturing PC in an CC expansion medium comprising a neurologic factor, and differentiating and CC culturing the expanded PC to form a culture of differentiated neuronal CC cells. The method is useful for culturing undifferentiated RS cells to CC form differentiated neuronal cells which are useful for treating a CC neurological disorder, especially Parkinson's disease in a patient. A CC gene product such as tyrosine hydroxylase, nerve growth factor (NGF), CC drain derived neuronaphic factor (BDNF), bFGF, glial derived growth CC factor (GDNF) NT-3, and NT-4/5 can be introduced into a brain of a CC subject. The method is useful for culturing dopaminergic, cholinergic and CC serotonergic neuronal cells. The differentiated neuronal cells are useful CC for treating neurological disorders such as Huntington's disease, malticator and contacts and contacts and contacts are useful contacts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         뭉
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC Alzheimer's disease, multiple sclerosis, severe seizure disorders concluding epilepsy, familial dysautonomia as well as injury or trauma to concluding epilepsy, familial dysautonomia as well as injury or trauma to concluding epilepsy, familial dysautonomia as well as injury or trauma to concluding epilepsy, familial dysautonomia as well as injury or trauma to concluding epilepsy, familial dysautonomia as well as injury or trauma to concluding epilepsy, familial dysautonomia as well as injury or trauma to concluding the survival as for mood and concluding the survival, assays are useful concluding to disorders resulting from aging. Assays are useful concerns of neuronal cells and to screen for antagonist or agonist of comprise of serotonin. Cell cultures comprising 50%-85% neurons which comprise 20-40% dopaminergic neurons and 1-3% astrocytes are useful for comprise 20-40% dopaminergic neurons and dopamine, neuronal cell survival, and the concluding the mechanical properties of differentiated neuronal cells. Cequences AAI67692-721 represent gene-specific PCR primers for CNS and dopaminergic specific regulatory genes, used for examining the developmental progression of ES cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 secondary structure. The method comprises amplifying a target nucleic acid having at least one accessible and one inaccessible site. Primers that form an extension product are identified as the oligonucleotides which can interact with the folded target nucleic acid. Oligonucleotides from the present invention can be used in novel detection methods for clinical diagnostic purposes, including the detection and identification of pathogenic organisms (e.g. HIV). The method allows the ability to rapidly analyse nucleic acid structures. ABL46034 to ABL46367 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Identifying oligonucleotides hybridizing to nucleic acids containing secondary structure, useful in clinical diagnosis, comprises identifying primers that interact with the target to form an extension product under
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          amplification conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            17-JUN-2000; 2000US-0212308P

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      be used as a primer or a probe, for detecting and/or amplifying a nucleic acid sequence. The compound is useful as a medicament, particularly for preventing and/or treating diabetes and/or pathology related to WRS, e.g. type 1 diabetes, type 2 diabetes, the others forms of diabetes, costeoporosis, arthritis, hepatic dysfunction, nephropathies or other renal dysfunction, or mental retardation. The cell the mammal or the polypeptide is useful for studying the expression or the activity of the EIF2AK3 protein, and the direct or indirect interactions between the EIF2AK3 protein, and chemical to indirect interactions between the involved in the activity of the EIF2AK3 protein and chemical or biochemical compounds, which may be involved in the activity of the EIF2AK3 protein. The cell or polypeptide is also useful for screening chemical or biochemical compounds capable of modulating the expression or the activity of the EIF2AK3 protein. ABK24521-ABK24624 represent human EIF2AK3 coding sequences and protein. ABK24511-ABK24624 represent human EIF2AK3 coding sequences and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                capable of modulating EIF2AK3. The nucleic acid is also useful for screening or diagnosing the diseases cited below. The nucleic acid of may be used as sense or anti-sense oligonucleotide. The nucleic acid may also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated variant of a mammal genomic sequence of the gene coding for the translation initiation factor 2 alpha kinase 3 (BIF2AK3). The EIF2AK3 nucleic acid variant is useful for the production of a recombinant or synthetic polypeptide, and for screening compounds capable of modulating EIF2AK3. The nucleic acid is also useful for

acid molecules and at least one oligonucleotide, where at reast a portion CC of the oligonucleotide is capable of hybridising with at least a portion CC of the nucleic acid molecule and where the oligonucleotide comprises a CC modified nucleotide at or near the 3'terminal nucleotide. The various CC analogue oligonucleotides are useful for quantification or detection of CC one or more target nucleic acid molecules in a sample during nucleic acid CC synthesis or amplification. The analogues are also useful for determining CC the presence or absence of one or more particular nucleotides at a CC specific position or positions in a target nucleic acid molecule. The CC analogue oligonucleotides can also be useful for synthesising or CC amplifying one or more nucleic acid molecules, by mixing one or more nucleic acid molecules acid templates or targets with the analogue oligonucleotides, and CC molecules complementary to all or a portion of the templates or targets. This polynucleotides acquence represents a nucleic acid detection and CC mis polynucleotides deligonucleotide of the invention
capable of hybridizing with a portion of nucleic acid, and comprises modified nucleotide at or near the 3^\prime-terminal nucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       invention relates to a composition comprising molecules and at least one oligonuclectide, w
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            307pp; English.

The various CC analogue oligonuclectides are useful for quantification or detection of come or more target nucleic acid molecules in a sample during nucleic acid synthesis or amplification. The analogues are also useful for determining CC specific position or positions in a target nucleic acid molecule. The CC specific position or positions in a target nucleic acid molecule. The CC analogue oligonucleotides can also be useful for synthesising or camplifying one or more nucleic acid molecules, by mixing one or more CC amplifying one or more nucleic acid molecules, by mixing one or more cucleic acid templates or targets with the analogue oligonucleotides, and concludes complementary to all or a portion of the templates or targets. This polynucleotide sequence represents a nucleic acid detection and CC discrimination related oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

The invention relates to a composition comprising one or more nucleic acid molecules and at least one oligonuclectide, where at least a portion of the oligonuclectide is capable of hybridising with at least a portion of the nucleic acid molecule and where the oligonucleotide comprises a modified nucleotide at or near the 3'-terminal nucleotide. The various analogue oligonucleotides are useful for quantification or detection of one or more target nucleic acid molecules in a sample during nucleic acid synthesis or amplification. The analogues are also useful for determining the presence or absence of one or more particular nucleotides at a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            07-NOV-2002

The analogue oligonuclectides can also be useful for synthesising or amplifying one or more nucleic acid molecules, by mixing one or more nucleic acid templates or targets with the analogue oligonucleotides, and incubating the mixture to synthesise or amplify one or more nucleic acid molecules complementary to all or a portion of the templates or targets. This polynucleotide sequence represents a nucleic acid detection and discrimination related oligonucleotide of the invention
                                                                                                                                                                                                                                           expression of Syntaxin 4 interacting protein. The antisense oligonucleotides of the invention are useful for inhibiting the expression of Syntaxin 4 interacting protein in cells or tissues. The antisense oligonucleotides are also useful for treating an animal having a disease or condition associated with Syntaxin 4 interacting protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 20 BP; 2 A;
                                                                                   (e.g. diabetes, obesity or a skeletal muscle disorder). The antisense oligonucleotides can also be used to prevent or delay infection, inflammation and tumour formation. The present DNA sequence represents a human Syntaxin 4 interacting protein antisense oligonucleotide. NOTE: The present sequence contains a phosphorothioate backbone and 2'-O-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel antisense compound that hybridizes and inhibits nucleic acid molecule encoding Syntaxin 4 interacting protein, useful for treat: diabetes, obesity and skeletal muscle disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                2'-0-methoxyethyl wing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               antisense oligonucleotide; diabetes; obesity; ske inflammation; tumour formation; phosphorothioate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human syntaxin 4 interacting

CC expressible selectable marker and modifying other allele by the recombination, of a promoter replacement fragment with a heterologous cc promoter, so that expression of the second allele is regulated by the CC promoter. (MI) is useful for constructing a strain of diploid fungal cells in which both alleles of a gene are modified. The diploid fungal cells having both alleles modified are useful for identifying a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent, an antifungal agent that inhibits the growth of a diploid fungus agene, and for identifying a therapeutic agent for treatment of a mammalian contivity of a gene product, preferably enzymatic activity, carbon cc ompound catabolism, biosynthetic, transporter, transcriptional, contivity. The method is useful for identifying a compound having the activity. The method is useful for identifying a compound having the cativity. The method is useful for identifying a compound having the cativity. The method is useful for identifying a compound having the primer used in the method of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on appears information simplied to Derment by the Birchael patent of office.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RESULT 1872

                                                                                                                  This invention describes a novel murine calpain protease 12 (capn12). The calpain protease of the invention, related proteins and nucleic acid that encodes it, are useful for treatment (including gene therapy) of diseases associated with insufficient expression of the calpain protease. The protein is also used to screen for calpain protein effectors and to raise specific immunoglobulins (Ig) useful for diagnosis. Also the polynucleotide encoding capn12 is useful, e.g. as primers and probes, for diagnosis of diseases, or predisposition to them, and for recombinant production of capn12. This sequence represents the murine calpain 12, capn12 exon 19 splice donor site described in the disclosure of the
                                                                                       Sequence 20
                                                                                                                                                                                                                                               Disclosure; Fig 2c; 36pp;
                                                                                                                                                                                                                                                                    New calpain protein 12 with cysteine protease activity, useful treating specific deficiency disorders.
                                                                                                                                                                                                                                                                                                                                                                          30-JUN-2000; 2000DE-01031932

                                                                                                                                                                                                                                This invention relates to an isolated polynucleotide encoding human NEDD-1, which is cytostatic in its action. The polynucleotide is useful for diagnosing diseases caused by mutation in human NEDD-1, and for diagnosing or monitoring diseases caused by altered expression of human NEDD-1. Fragments of NEDD-1 are useful as hybridisation probes and
                                                                                                                                                                                            primers, and to direct expression or synthesis of epitopic or immunogenic protein fragments. The proteins are useful as therapeutic supplement in patients with specific deficiency in human NEDD-1 production, and for treating subjects preferably with defects in NEDD-1. The present sequence

The human gene for HKNG1 is located on chromosome 18p in an area CC associated with bipolar affective disorder, BAD. Also included are an CC expression vector comprising the nucleic acid, a host cell expressing the nucleic acid, a host cell expressing the CC nucleic acid, an anti-HKNG1 antibody, a method of identifying modulators of HKNG1, and identifying an individual (at risk of) having HKNG1—CC mediated disorder comprising detecting the presence or absence of a CC disorder, where the presence of the polymorphism indicates that the CC individual (is at risk of) having HKNG1—mediated disorder. A (small CC molecule) compound which modulates (inhibits or potentiates) expression CC of a HKNG1 gene or gene product in a human individual is useful for the treatment of a HKNG1—mediated disorder such as bipolar affective disorder CC (BAD), severe bipolar affective (mood) disorder (BP-I) and schizophrenia. CC The present sequence is PCR primer which amplifies a HKNG1 exonic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RESULT 1876
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

                                                                                                                                                                        Ş
                                                                                                          RESULT 1877
                                                                                                                                                                                                                                                                                        The present invention describes a compound (1) 8-50 nucleobases in length targeted to a nucleic acid molecule encoding caspase 7, which specifically hybridises with and inhibits the expression of caspase 7. (1) has antiinflammatory and cytostatic activities, and can be used in antisense therapy and as an inhibitor of caspase 7 expression. (1) is useful for inhibiting the expression of caspase 7 in human cells or tissues, and for treating a human having a disease or condition casociated with caspase 7 including inflammatory condition hyperproliferative disorder (cancer), or bone metabolism or cholesterol disorder. (1) is useful for diagnostics, therapeutics, prophylaxis and as cresearch reagent and kits. (1) is useful prophylactically to prevent or delay infection, inflammation or tumour formation. The present sequence represent a mouse caspase 7 inhibiting chimeric phosphorothioate coligonucleotide having 2. More wings and a deoxy gap, which is used in an areas in invention.
                                                                                                                                                                                                       Matches
                                                                                                                                                                                                                Query Match

                                                                                                                                                                                                                                                                                                                                                         useful for inhibiting the expression of caspase 7 in human cells or tissues, and for treating a human having a disease or condition associated with caspase 7 including inflammatory condition, hyperproliferative disorder (cancer), or bone metabolism or cholesterol disorder. (I) is useful for diagnostics, therapeutics, prophylaxis and a research reagent and kits. (I) is useful prophylactically to prevent or delay infection, inflammation or tumour formation. The present sequence represent a mouse caspase 7 inhibiting chimeric phosphorothicate oligonucleotide having 2'-MOE wings and a deoxy gap, which is used in an area of the contraction of the contracti
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a compound (I) 8-50 nucleobases in length targeted to a nucleic acid molecule encoding caspase 7, which specifically hybridises with and inhibits the expression of caspase 7.

(I) has antiinflammatory and cycostatic activities, and can be used in antisense therapy and as an inhibitor of caspase 7 expression. (I) is
                                                                                                                                                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel antisense compounds targeted for modulating gene expression and expression of caspase 7 in humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Key

                                                                                                                                                                                                                                                                                                                                                              The invention relates to an isolated or substantially pure Von Willebrand CC factor-cleaving protease (VWF-cp) polypeptide. WWF-cp is useful for CC purifying vWF which involves providing vWF-cp as a ligand, contacting a CC solution comprising vWF with the polypeptide ligand under conditions comprising vWF with the polypeptide ligand under conditions compression wWF wWF-cp is useful for producing anti-vWF-cp polypeptide antibodies CC wWF. vWF-cp is useful for producing anti-vWF-cp and isolating the anti-cc wWF-cp polypeptide antibodies from the animal. wWF-cp is useful for CC wWF-cp polypeptide antibodies from the animal. wWF-cp is useful for CC wWF-cp polypeptide antibodies from the animal. wWF-cp is useful for CC wWF-cp polypeptide antibodies from the animal. wWF-cp is useful for CC thromboembolic disease such as thrombocytic purpura (TTP), CC Henoch-Schonlein purpura, preeclampsia, neonatal thrombocytopaenia or CC haemolytic-uraemic syndrome. wWF-cp can also be used for processing CC construction expression systems and generating transgenic animals which CC cense the polypeptide in vivo. The present sequence is human vWF-cp creaming transgenic animals which CC cense cloning RT-cpc primer
                                                                                                                                                                                                                                                    Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a method for identifying a compound that conditions in the control of the presence in a mammalian cell comprising culturing the cell in the presence and absence of the compound, assaying expression of at least cone cellular gene (G1a) from 56 or a gene (G2) from 64 genes, with conformation gene (G1a) from 56 or a gene (G2) from 64 genes, with conformation gene (G1a) from 56 or a gene (G2) from 64 genes, with conformation gene (G1a) from 64 genes, with conformation gene (G1a) from 64 genes, with conformation gene (G1a) from 64 genes, with conformation of (G1a) or compound that induce senescence in a mammalian cell; conformation generation or neoplastic cell growth; (3) treating a compound condition relating to abnormal cell proliferation or condition cell growth; (3) treating a compound that inhibits conformation growth; or (4) identifying a compound that inhibits conformation or treating or for assessing efficacy of treatment of a compound cell growth. The compound cell growth from condition relating to abnormal cell proliferation or condition relating to abnormal cell proliferation or compound that inhibits conformation of cellular gene expression. The compound cell growth cell growth. The compound of the invention has a growth-condition relating to abnormal cell proliferation or inhibitory effort without revolucions gratemic side afforts found without the compound of the invention has a growth-condition relating to abnormal cell proliferation or inhibitory effort without revolucions gratemic side afforts found without the compound of the invention has a growth-condition relating to abnormal cell proliferation or inhibitory effort without revolucions gratemic side afforts to a growth.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to oligonucleotides having at least one non-terminal pyrimidine nucleoside modified and additionally having the 5'-and/or 3'-terminal modified. These can be used in the treatment of viral infections, such as HIV, HSV-1, HSV-2, influenza virus, VSV, hepatitis B and papilloma viruses, cancer and diseases involving integrins and cell-adhesion receptors. The present sequence is an antisense oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                     Winkler I;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   oligonucleotides having modified non-terminal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       pyrimidine nucleoside(s), useful e.g. for treating cancer or viral diseases or as diagnostic reagents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ..

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated polynuclectide comprising a sequence variation of a mouse HYPLIP1 CDNA or a human FCHL1 (familial combined hyperlipidaemia) gene. The FCHL1 polynuclectide, the FCHL1 polypeptide or antibody immunoreactive to the FCHL1 polypeptide are useful for treating or preventing cancer associated with expression of FCHL1, as well as for recating lipid disorder. The mouse HYPLIP1 cDNA or human FCHL1 gene are also useful for diagnosing or prognosing a predisposition to lipid disorder and cancer. ABK70902-ABK71303 represent mouse HYPLIP1, human FCHL1 coding sequences and PCR primers of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                          New mouse HYPLIP1 and human FCHL1 (familial combined hyperlipidemia) genes and their sequence variations, useful for diagnosing, treating or preventing lipid disorders and cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Modified antisense oligonucleotide; antisense; HIV; cancer; infection; cytostatic; virucide; anti-HIV; hepatotropic; antiinflammatory; phosphorothioate backbone; integrin; cell-cell adhesion receptor; ss.

PRANTA NAME OF COLOR OF COLOR

```
The invention relates to a novel isolated nucleic acid molecule comprising a sequence that encodes a thioesterase or thioesterase domain, derived from a bacterial daptomycin biosynthetic gene cluster. The proteins of the invention have antibacterial, fungicide, virucide, antiparasitic, immunomodulator, antilipemic, and cytostatic activity. The colynucleotides may have a use in gene therapy. The compositions and cyclic peptides and improving yield of a product in a cell expressing and cyclic peptides and improving yield of a product in a cell expressing compounds or in producing new compounds, such as antibiotics, antifungals, antivirals, antiparasitics, antimitotics, antitumour agents, immunomodulatory agents, anti-cholesterolemic agents, siderophores, compounds or and cycletatics. The sequence represents a PCR primer used in the invention to amplify the S. roseosporus daptomycin biosynthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   NOVX; cytostatic; cardiant; antiarteriosclerotic; antiasthmatic; cancer; hypotensive; cardiomyopathy; bronchial asthma; gene therapy; vaccine;
                                                                          Isolated nucleic acid molecule from a bacterial daptomycin biosynthetic gene cluster encoding a thioesterase or thioesterase domain, useful for generating novel linear and cyclic peptides, and products in a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human NOV-associated forward primer from primer-probe set Ag3338.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ..

                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to novel antisense oligonucleotides which are targetted to nucleic acids encoding human raf proteins and capable of inhibiting raf expression. The invention also relates to methods of inhibiting hyperproliferation of cells which involves contacting the hyperproliferating cells with a therapeutically effective amount of an oligonucleotide of the invention. The method is useful for treating cancer, angiogenesis or neovascularisation, especially ocular angiogenesis or neovascularisation. The present DNA sequence is an antisense oligonucleotide targetted to human c-raf kinase

NOVX polypeptides and polynucleotides, useful for preventing or treating a disorder associated with aberrant NOVX expression or activity e.g., cancer, hypertension, atherosclerosis, cardiomyopathy or bronchial asthma

# Example C; Page 565; 1103pp; English.

This invention describes novel human NOVX polypeptides which have vytostatic, cardiant, antiarteriosclerotic, antiasthmatic and hypotensive activity. Pharmaceutical compositions comprising the NOVX proteins or nucleic acid molecules or NOVX antibodies are useful for preventing or treating a disorder associated with aberrant NOVX expression or activity

ö
e.g. cancer, hypertension, atherosclerosis, cardiomyopathy or bronchial asthma. The products of the invention can be used for gene therapy or in a vaccine. ABX19460-ABX13462 and ABX97186-ABX97593 represent PCR primers and probes used in the amplification and isolation of the NOVX polynucleotides represented in ABX97008-ABX97185 which encode the polypeptides represented in ABX97108-ABX97185 which encode the

Composition, useful for identifying modulator of receptor for treating asthma and glomerulonephritis, comprises AGP-3 (tumor necrosis factor ligand family member) receptor and encoding nucleic acids.

## Disclosure; Page 39; 124pp; English

The invention relates to a composition (I) comprising AGP-3 receptor (tumour necrosis factor ligand family member) related protein (II) attached to a vehicle protein. (I) is useful for modulating AGP-3-related activity in mesenteric lymph nodes (MIN) of a mammal. (II) is useful in related to AGP-3-Related protein and for identifying compounds (agonists or antagonists) that interact with AGP-3R proteins. (II) is also useful or identifying intracellular proteins that interact with the respective cytoplasmic domains by yeast two-hybrid screening process. (II) is cytoplasmic domains by yeast two-hybrid screening process. (II) is involved in B cell growth, survival and activation particularly in lymph node, spleen, and Peyer's patches. AGP-3R agonists and antagonists identified using (II) are used for modulating B cell response and are

used to treat diseases characterised by inflammatory processes or deregulated immune response such as rheumatoid arthritis, graft-versusch of disease, Crohn's disease, lupus, etc. [II] is also useful in the production of hybridoma cells which are derived from B cells, which involves treating the hybridoma cells with [II]. [II] is useful in the involves treating the hybridoma cells with [II]. (II] is useful in the creatment of inflammatory conditions of joints, e.g., rheumatoid creatment of inflammatory conditions of joints, e.g., rheumatoid creating acute pancreatitis, anyotrophic lateral sclerosis (ALS), Alzheimer's disease, asthma, atherosclerosis, cachexia/anorexia, cischaemic injury including cerebral ischaemia, multiple myeloma, multiple cischaemic injury including cerebral ischaemia, multiple myeloma, multiple schock, etc. The nucleic acids are also useful for developing transgenic animals expressaing (II), which are useful for producing the polypeptides and for the study of in view biological activity. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /note= "2'-methoxyethyl (2'-MOE) nucleotides. Sequences ABL94252-ABL94476 represent antisense oligonucleotides targeted to the human or mouse CCAAT/enhancer-binding protein alpha (C/EBP alpha)

to the human or mouse CCAAT/enhancer-binding protein alpha (C/EBP alpha)

content and the content of the human and/or mouse C/EBP

alpha RNA, and were analysed for their effect on C/EBP alpha mRNA levels

content and the content of the content of the human and/or mouse C/EBP

content of the c

The invention relates to inhibiting the signal transduction of KDR/FIk-1 (Kinase insert domain-containing receptor/fetal liver kinase-1) is by cusing a substance inhibiting the binding of a signal-transducing molecule to KDR/FIk-1 phosphorylated at tyrosine at the 1175-position. Also included are methods of detecting/inhibiting/screening for cell proliferation, angiogenesis, KDR/FIk-1 signal transduction and KDR/FIk-1 phosphorylation at tyrosine at the 1175-position using the binding inhibitors, compounds obtained by the screening methods, drugs containing the inhibitors, a monoclonal antibody or its fragment recognising KDR/FIk-1 phosphorylated at tyrosine at the 1175-position, a DNA encoding the monoclonal antibody or its fragment, a recombinant vector containing the monoclonal antibody or its fragment, a recombinant vector containing the monoclonal single is useful for screening substances inhibiting the binding of a signal-transducing molecule to KDR/FIk-1 phosphorylated at tyrosine at 1175-position, as cell proliferation inhibiting the binding of a signal-transducing molecule to KDR/FIk-1 phosphorylated at tyrosine at 1175-position, as cell proliferation containing the phosphorylated at tyrosine at 1175-position, as cell proliferation inhibitors and anglogenesis inhibitors for transducing arthritis. A method for detecting anglogenesis is also provided. The present sequence is a pCR primer used to create a KDR/FLK-1 mutant where the Tyr at 801 is changed
                                                                                                                                                                                                                                   Screening substances inhibiting the binding of signal-transducing molecule to KDR/Flk-1 phosphorylated at tyrosine at 1175-position, as cell proliferation inhibitors and angiogenesis inhibitors for treatment of e.g. tumor.
                                                                                                                               Takahashi T, Furuya A,

Designing capture oligonucleotide probes for use on a support to which complementary oligonucleotides hybridize with little mismatch.

Example 5; Fig 29; 300pp; English.

The present libration describes a method (MI) for despirating capture oligonucleotide probes (II) will hybridise with little mismatch, where coligonucleotide probes (II) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents c.g. Cryptococcus neoformans, Candida albicans and Aspergillus funigatus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Barr virus and polio virus, and parasitic infectious agents c.g. Estected from Onchoverva volvulus, Entamoeba histolytica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such as 1 hydroxylase deficiency, Turner Syndrome and obesity defects.

CC medinesis. The method is also useful for detecting genetic diseases such as 1 hydroxylase deficiency, Turner Syndrome and obesity defects.

CC petecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, psi method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the correlating (using a computer) identified ligation to a presence or absence of the target uncleotide sequences. Ball32074 to presence or absence of the target uncleotide sequences. Ball32074 to capture The present invention describes a method (M1) for designing of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Transglutaminase; TGM; transamidation; autoimmune disease; Addison's disease; Al haemolytic anaemia; Al thrombocytopenic purpara; Al thyroid disease; atrophic gastritis; pernicious anaemia; Chron's disease; colitis ulcerosa; Goodpasture syndrome; IgA nephropathy; IgG glomerulonephritis; ulcerosa; Goodpasture syndrome; IgA nephropathy; polymyositis; primary biliary cirrhosis; primary scleroshy sclerophy; progressive systemic sclerosis; recurrent perioarditis; systemic sclerosis; recurrent perioarditis; systemic sclerosis; arthitis; rheumatism; sarcoidosis; SLE; splenic atrophy; diabetes; Wegener granulomatosis; ulcerative colitis; vasculitis; vitiligo; PCR; primer; ss.
                                                                                                                                                                                             The present invention relates to nucleic acid sequences encoding human peptide histidine transporter 1 (hPHT1) protein, the hPHT1 proteins and methods for using them. The nucleic acid sequences of the invention are is useful for screening a test compound for human PHT1 modulating activity. The hPHT1 proteins are useful as a target for evaluating peptide and peptide-based drug transport. The functional characterisation of hPHT1 and the ability to correlate the Michaelis-Menten kinetics for a particular substrate to the molar expression level of hPHT1 provides crucial information regarding the ability of this transporter to facilitate the uptake and transport of peptides and peptide-based drugs.
                                                                                                                                                                                                                                                                                                                                                                    The PHT1 proteins facilitate peptide transport across cell membranes in the pHT1 proteins facilitate peptide transport across cell membranes in the gastrointestinal tract and other organs in which they are expressed. The identification of full length hPHT1 clone facilitates the development of optimal peptide-based drugs for treating patients with hPHT1-related diseases. AAS20878-AAS20911 represent reverse transcriptase (RT)-PCR
                                                                                  Novel isolated human peptide histidine transporter which facilitates peptide transport across cell membranes in gastrointestinal tract, useful as target for evaluating peptide and peptide-based drug transport.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

Addison's disease, Al haemolytic anaemia, Al thrombocytopenic purpara, Addison's disease, Al haemolytic anaemia, Al thrombocytopenic purpara, thyroid disease, atrophic gastritis, pernicious anaemia, Chron's disease, colitis ulcerosa, Goodpasture syndrome, 1gA nephropathy or IgG glomerulonephritis, myasthenia gravis, partial lipodystrophy, polymyositis, primary biliary cirrhosis, primary sclerosing cholangitis, progressive systemic sclerosis, recurrent pericarditis, relapshing polychondritis, rheumatoid arthritis, rheumatism, sarcoidosis, Sjogren's syndrome, SiE, splenic atrophy, type I (insulin-dependent) diabetes mellitus, Megener granulomatosis, ulcerative colitis, wasculitis (both systemic and cutaneous) and vitiligo. This sequence represents a primer used in the study of transplutaminase genes in which DNA, amino acid sequences and chromosomal locations of novel transglutaminases are
                                                                                                                              The invention relates to nucleic acids which encode novel polypeptides having transglutaminase activity. The compositions of polypeptide are useful for transamidation reactions on peptides and polypeptides. Detection of the polypeptides with transglutaminase activity are useful in a diagnostic method in a subject or in cells derived from a subject having an autoimmune disease. The method for detecting transgluataminase proteins may be used to diagnose autoimmune diseases which include
Nucleic acids which encode novel transglutaminase enzymes TG-Z and TG-Y
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Lipid metabolism regulator; LTR; plant; transgenic plant;

ij compound, e.g. lipids for generating seed oils which have the ability reducing risk of heart disease.

Example 2; Page 34; 72pp; English

The present sequence is that of a primer for an AINTEGUMENTA-like protein gene of Arabidopsis thaliana. Overlapping PCR primers (see AB081398-407)

Changes in 2 wril mutants compared to wild-type sequences in order to changes in 2 wril mutants compared to wild-type sequences in order to identify the true wril gene. In subsequent experiments, wril mutants were complemented with cosmids containing wild-type genomic DNA, and PCR was used to produce a full-length wril CDNA (see AB081395) encoding a lipid metabolism requlator (LMR) protein (see AB081395) encoding a lipid metabolism a transcription factor regulating lipid and seed storage compound metabolism during seed development. The invention relates to the use of LMR nucleic acids in the production of transgenic plants having a modified level of a seed storage compound. The level of a lipid, fatty acid, starch or seed storage protein can be modified, yielding a seed oil that is medically and nutritionally useful in reducing the risk of heart

The present invention relates to a recombinant expression construct 

. 0 encoding a reporter gene operably linked to a promoter from a mammalian gene induced by a cyclin-dependent kinase (CDK) inhibitor. The construct is useful for identifying compounds that inhibit the induction of genes induced by CDK inhibitors. The compounds are useful for preventing or treating a disease caused by CDK inhibitor induced gene expression, e.g. cancer other than colon cancer, renal failure, Alzheimer's disease, amploidosis, age-related diseases, atherosclerosis or arthritis. The present sequence is a PCR primer used to amplify a human promoter suitable for use in the construct of the invention New recombinant blood coagulation factor VIII and its production process and medicinal composition. The invention relates to a novel recombinant blood coagulation factor VIII, its production process and its medicinal composite for treating type-A haemophilia. The invention further comprises a medicinal composition containing the blood coagulation factor which promotes blood coagulation to the blood plasma of type-A haemophilia patients. This polynucleotide sequence represents an oligo relating to the recombinant blood coagulation factor VIII protein of the invention. The invention relates to a novel compound that is 8-50 nucleobases in length which is targeted to a nucleic acid molecule encoding WRN (RECQL3) helicase and specifically hybridises with and inhibits the expression of WRN. The antisense oligonucleotide of the invention demonstrates cytostatic and virucide activities and may be useful for treating an animal having a disease or condition associated with WRN, such as a hyperproliferative disorder, particularly cancer, or a disease or condition involving premature aging or viral infection. The antisense oligonucleotide may also be utilised during gene therapy procedures. The courrent sequence is that of the antisense 2' methoxyethyl (2' MOE) gapmer of the antisense 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          oligonucleotide of the invention which was targeted to human WRN helicase. The current sequence comprises a central "gap" region of 10 2'-deoxymucleotides, which is flanked on both sides by 5-nucleotide 2-MOE "wings". The backbone linkages are phosphorothicate and all cytidines are

The sequences given in ABQ80141-52 represent primers which were used to identify wild type and variant loci in the human interloukin 4 receptor identify wild type and variant loci in the human interloukin 4 receptor (IL4R). These primer sequences were used in the method of the invention of comprises detecting the presence of an insulin dependent diabetes. The method comprises detecting the presence of an insulin dependent diabetes mellitus (IDDM)-associated interleukin 4 receptor allele in a nucleic consistent of the individual, where the presence of the allele indicates the individual's risk for type 1 diabetes. The method identifies one or more single nucleotide polymorphism (SNP) within the IL4R gene listed in individual's risk for type 1 diabetes. The IL4R SNP's are also useful for determining an individual's risk for any autoimmune disease or condition of the analyse right mediated disease, systemic lupus multiple sclerosis, inflammatory bowel disease, systemic lupus erythematosus, psoriasis, scleroderma, Grave's disease, systemic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Determining an individual's risk for type 1 diabetes, comprises detecting
the presence of an insulin dependent diabetes mellitus-associated
interleukin 4 receptor allele in a nucleic acid sample of the individual.
                                                                                                                                                                                                                                                                                      Human; interleukin 4 receptor; IL4R; type 1; diabetes; allele; insulin dependent diabetes mellitus; IDDM; myasthenia gravis; PCR; single nucleotide polymorphism; SNP; autoimmune disease; amplify; Thelper type 1 mediated disease; rheumatoid arthritis; primer; multiple sclerosis; inflammatory bowel disease; systemic solarosis; systemic lupus erythematosus; psoriasis; scleroderma; Grave's disease; Guillain-Barre syndrome; Hashimoto's thyroiditis; ss.

Oral pharmaceutical formulation for delivering bioreactive macromolecule to mucosal surface, contains drug, bioadhesive compound, and penetration

Hardee GE;

Disclosure; Page 28; 62pp; English.

The present invention describes an oral pharmaceutical formulation (I) for delivering a bioreactive macromolecule to a mucosal surface. (I) comprises a first population of carrier particles comprising drug and a bioadhesive compound, and a second population of carrier particles comprising a penetration enhancer. Also described is a method for enhancing the mucosal absorption of the bioactive macromolecule in a mammal (preferably a human) by mucosally administering (I). (I) has antitutiver, antituflammatory, antitheumatic, antitutering and cytostatic activities. (I) can be used for delivering a bioreactive macromolecule to a mucosal surface. It is used for the oral delivery of a drug to an ulcerative colitis, rheumatoid arthritis, Crohn's disease, inflammatory bowel disease, or undue cellular proliferation (cancers and tumours). The present sequence represents an exemplary oligonucleotide from the present animal encompassing a human as well as other mammals, reptiles, fish, amphibians and birds. It is used to deliver drugs including peptides, proteins, monoclonal antibodies their fragments, nucleic acids (DNA and RNA), oligonucleotides, antisense oligonucleotides, and small molecules. It can be used to examine the function of various proteins and genes in an animal, including those that are essential to animal development. It can be used for the treatment of animals that are known or suspected to from any disease treatable with the inventive composition, e.g. invention, which can be used to inhibit ICAM-1 suffer

The invention relates to a DNA or RNA construct capable of expressing interleukin (IL)-2 in a warm-blooded animal or biological preparation, comprising a Vpr activated promoter, a transcribable DNA segment coding for IL-2 and a secretory DNA encoding for a signal peptide functional in mammary cells and operably linked between the promoter and the DNA segment to facilitate secretion of IL-2. The construct is useful for increasing the immune response of a warm-blooded animal or biological preparation, by introducing the construct in stem cells, antigen preparation, by introducing the construct in stem cells, antigen preparation, by introducing the construct in stem cells, antigen preparation, by introducing the construct in stem cells, antigen cells, of the warm-blooded animal or biological preparation to obtain a transfected cell populations and administering a pharmaceutically effective amount of the transfected cell populations to the warm-blooded immal or biological preparation. The method is useful for stimulating immune immunocompromised pattent. The method is useful for stimulating immune response in immunocompromized pattents affected with HIV, concern and

Compounds of the invention are antisense oligonucleotides comprising at least one modified internucleoside linkage, which is a phosphorchhicate linkage, at least one modified sugar moiety, which is a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase, which is a 5-methylcytosine. Preferably, the antisense oligonucleotide is a chimeric oligonucleotide. The compound of the invention is useful for preparing a composition for treating a hyperproliferative disorder. The methods are useful for inhibiting the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New compound having sequence targeted to nucleic acid encoding inhibitor-kappa B kinase-gamma, useful for preparing composition for treating e.g., cancer, or inflammatory or autoimmune disorder.

The specification describes a method of analysing DNA or RNA targets. The method comprises contacting the targets with oligonucleotide probes attached to an enzyme cofactor marker which is recognized less by the enzyme when it is on a free oligonucleotide than when it is on a hybridized oligonucleotide. The method is useful for analysing DNA or RARGETS. The invention is used to determine the amount of a target nucleic acid in a biological sample and the level of complementarity between the probe and the target nucleic acid. The present sequence represents an oligonucleotide probe attached to flavin.
                                                                                                                                                                                                                                                                                                                                                                cofactor marker for flavin reductase. The probe, together with its complement AB277540, was used to study the activity of flavin reductase

complementary to a region of nucleic acid encoding epidermal growth factor receptor (BGFR) with location 245-1117, 2407-3201, 3786-4102 or 4574-45633. The methods and compositions of the invention are useful for enhancing inhibition of EGFR gene or mRNA expression, and reducing cancer cell proliferation, in particular cancer cells of the colon, ovarian or breast. Sequences ABZ23811-832 represent specific examples of such antisense oligonucleotides that inhibit the EGFR mRNA expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /note= "nucleotides 1-5 & 16-20 are 2'-methoxyethoxy (MOE) nucleotides, nucleotides 1-4 & 16-19 are linked via phosphodiester linkages, nucleotides 6-15 are 2'-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New synthetic oligonucleotide complementary to nucleic acids encoding epidermal growth factor receptor (EGFR), useful for inhibiting the EGI gene or mRNA expression, and reducing cancer cell proliferation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            antisenes, antiarthritic; antiinflammatory; kinase inhibitor; mouse; inflammatory disease; rheumatoid arthritis; gene therapy; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         THE LEFT FERNOR WAY AND WAY AN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           which have been immobilised onto a predetermined region of its surface, in which have been immobilised onto a predetermined region of its surface, in which the region on the substrate has such a shape as to allow the concentration of signals caused by binding of the ligands to receptors in immobilisation of such ligands. The substrates are applicable in gene engineering for studying relationship between structures and biological activity e.g. effect of endocrine disrupters on various genes and also in investigating the effect of formones, drugs and other chemicals on the environment. Such substrates are highly sensitive in detecting the ligand receptor binding, with affinity and reproducibility. The ligand-receptor binding tuned results. Aba00221 to AbA00282 represent POR primers used for amplifying genes in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ..

Sequences ABZ74952-ABZ74991 represent antisense oligonucleotides targeted to the human p70 S6 kinase gene, which inhibit its expression. The antisense oligonucleotides were designed to target different regions of the human p70 S6 kinase RNA, and were analysed for their regions of p70/P85 kinase RNA, and were analysed for their effect on mRNA confidence in the regions of kinase (also known as SK6, p70/P85 s6 kinase, p70/P85 ribosomal S6 kinase and pp70s6k) is a serinethreonine kinase responsible for the phosphorylation of the ribosomal S6 protein, which in turn stimulates protein synthesis. p70 S6 kinase confined in the regulation of the immune response. p70 S6 kinase is implicated in the regulation of the immune response. p70 S6 kinase is implicated in the regulation of the immune response. p70 S6 kinase is congression of colon cancer and in the development of lipotoxic disorders and obesity. The oligonucleotides of the invention and reatment of conditions associated with p70 S6 kinase, condisorders. They are also useful in research and metabolic disorders. They are also useful in research and diagnostics for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel antisense compound which is targeted to nucleic acid encoding p70 S6 kinase, and inhibits expression of p70 S6 kinase, useful for treating a condition associated with p70 S6 kinase, e.g. cancer.
                                        /note= "Optionally 2'-methoxyethyl (2'-MOE) nucleotides.
All 2' MOE cytosines are 5-methylcytosine"
                                                                                                                                                     /note= "Optionally 2'-methoxyethyl (2'-MOE) nucleotides.

/note= "Phosphorothioate linkages. When bases 1-5 and 16-
20 are not 2'-methoxyethyl (2'-MOE) nucleotides, all
cytosines in the oligonucleotide are 5-methylcytosine"
                                                                                                                                                                                                                                                                                                                                                                                                  New antisense compound, useful for preparing a composition for diagnosing, treating or preventing inflammatory diseases, e.g. rheumatoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes a novel antisense compound, which is 8-30 nucleobases in length targeted to a nucleic acid molecule encoding p38 mitogen-activated protein Kinase (MAPK). The products of the invention have antiarthritic and antilinflammatory activity, can act as act as kinase inhibitors. The antisense compound is useful for preparing a kinase inhibitor of diagnosing, treating or preventing inflammatory diseases, e.g. rheumatoid arthritis or for use in antisense gene therapy. This sequence represents an antisense oligonucleotide used in a method to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; p70 S6 kinase; SK6; p70/p85 s6 kinase; pp70s6k; p70/p85 ribosomal S6 kinase; serine-threonine kinase; ribosomal S6 kinase; serine-threonine kinase; ribosomal S6 protein phosphorylation; protein synthesis; call cycle progression; immune response; signalling cascade; cancer progression; lipotoxic disorder; obesity; metabolic disorder; hyperproliferative disorder; cancer; cytostatic; expression inhibition; phosphorothioate; antisense oligonucleotide; ss.

The sequences given in ABO80256-69 are primers which were used to identify the presence of vascular endothelial growth factor (VBGF), or the VBGF receptors, FIR1, FLT-1 and FLT-4 in human stem cells (HSC). The method of the invention for alleviating or reducing a symptom of a disease or disorder of the nervous system comprises administering platelet-derived growth factor (PBGF), vascular endothelial growth factor (VBGF), a combination of PBGF and VBGF, or a PBGF or VBGF agonist, to a patient in order to modulate neural stem cell or neural progenitor cell critity in vivo. The method is useful for alleviating or reducing the neurodegenerative disorders, neural stem cell disorders, neural progenitor disorders, neurological traumas, compensative disorders, neurological traumas, affective disorders, ischaemic disorders or learning and memory disorders. In particular, the method is useful for alleviating or reducing Parkinson's disease and disorders, Huntington's disease, disorders in particular, the method is useful for alleviating or treating Parkinson's disease and disorders, Huntington's disease, ischaemic stroke, spinal cord injury or cancer-related brain/ spinal cord disorders, phobias, stress and capression/disorder, anxiety syndromes/disorders, phobias, stress and capted syndromes, obsessive compulsive behaviour syndromes, seasonal mood disorder, borderline personality disorder, cerebral palsy, life style curisorder, borderline personality disorder, cerebral palsy, life style drug, multi-infarct dementia, Lewy body dementia, age related/geriatric dementia, Lewy body dementia, age related/geriatric dementia, enjugy, trauma related brain/spinal cord injury, anti-cencer creatment related brain/spinal cord injury, environmental toxin critated brain/spinal cord injury, environmental toxin called brain/spinal cord injury, environmental toxin called brain/spinal cord injury, environmental toxin in the mannifacture of a medicanent for alleviating or treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             is useful in the manufacture of a medicament for alleviating or treating these diseases or disorders, accelerating growth of neural stem cells or neural progenitor cells, or inducing proliferation or differentiation of these cells. This primer gives an estimated band size of 378 bp
                                                                                                                                                                                                                    Use of platelet-derived growth factor, vascular endothelial growth factor, or their modulators for modulating neural stem cell or neural progenitor cell activity, particularly for treating e.g. Alzheimer's,
                                                                  Kuhn GH, Plate K, Schanzer A, Wachs F;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0.8%; Score 13.6; DB 1; Length 20;

```
The invention relates to antisense oligonuclectides (ACF33752-ACF33779)

targeted to the human CREB (GAMP response element binding protein) gene,
which inhibit its expression. The oligonuclectides were designed to
target different regions of human CREB mRNA, and were analysed for their

cffect on CREB expression by quantitative real-time PCR. CREB (also known
cffect on CREB expression by quantitative real-time PCR. CREB (also known
cffect on CREB expression by quantitative real-time PCR. CREB (also known
cffect on GREB expression by quantitative real-time PCR. CREB (also known
ccffect on GREB expression and activates transcription of target genes in
response to a diverse array of stimuli including peptide hormones, growth
cffectors and protein kinases. It is a component of intracellular
ccffectors and protein kinases. It is a component of intracellular
ccffectors and protein kinases. It is a component of including spermatogenesis, circadian rhythms and memory. Overexpression
cincluding spermatogenesis, circadian rhythms and memory. Overexpression
cffers has been found to induce apoptosis in certain cells, although
ccffers overexpression may also be linked to cancer as it is constitutively
cactivated in human somatotroph adenomas. CREB may also play a role in the
cdevelopment of drug dependency, as it has been found to mediate morphine-
cdevelopment of drug dependency, as it has been found to mediate morphine-
cdevelopment of drug dependency, as it has been found to mediate opiate
diagnosis, prevention and treatment of CREB-related disorders, such as
chyperproliferative disorders (particularly cancer, e.g., those of blood
and soft tissuel, diseases or conditions arising from aberrant apoptosis,
cr neuronal disorders. The present sequence represents a human H-ras
cor neuronal disorders. The present sequence represents a positive control in
determining optimal oligonucleotide concentration for a particular cell

The invention comprises nucleic acids that show increased expression in human neuroblastomas with poor prognosis over those with a good prognosis. The nucleic acids of the invention are useful as a tool for distinguishing neuroblastomas with a favourable prognosis (spontaneous regression) from neuroblastomas with a poor prognosis (high malignancy). The DNA sequences ABT32224 - ABT32571 represent oligonucleotides used in an example of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acids having higher expression in human neuroblastoma with poor prognosis for diagnostic prediction of neuroblastoma prognosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             BCL2-associated X; BAX; nootropic; neuroprotective; antiparkinsonian; anticonvulsant; ophthalmological; antidiabetic; virucide; antisense therapy; BAX antagonist; BAX inhibitor; familial amylotrophic lateral sclerosis; Alzheimer's disease; Parkinson's disease; Hodgkin's disease; cartilage-hair hyperplasia; diabetes-associated ocular disorder; scrapie infection; aberrant apoptosis; human; phosphorothioate; ss.

trageted to a nucleic acid molecule encoding BCL2-associated X (BAX)

targeted to a nucleic acid molecule encoding BCL2-associated X (BAX)

protein, where the compound specifically hybridises with the nucleic acid

molecule encoding BAX protein and inhibits the expression of BAX protein.

The compound specifically hybridises with at least 8 mucleobase portion

of an active site on a nucleic acid molecule encoding BAX protein. Also

condition (1) a composition comprising (1) and a pharmaceutical carrier

tissues comprising contacting the expression of BAX protein in cells or

tissues comprising administering to the animal (1) so that expression of

protein comprising administering to the animal (1) so that expression of

CR BAX protein is inhibited. (1) has nootropic, neuroprotective,

creating an animal having a disease or condition associated with BAX

protein is inhibited. (1) has nootropic, neuroprotective,

creating an interpretation of the animal (1) so that expression of

antiparkinsonian, anticonvulsant, ophthalmological, antidabetic and

virucide activities, and can be used in antisense therapy, and as a BAX

creating antisense compounds (1) are useful for modulating the

expression of BAX protein, e.g. familial amylotrophic lateral

creatinge-hair hyperplasia, diabetes-associated ocular disorders or

cratilage-hair hyperplasia, diabetes-associated ocular disorders or

creating are useful as research research reagents and in diagnostics. The

compounds are useful as research reagents and in diagnostics. The The present invention describes a compound (I) 8-50 nucleobases in length oligonucleotide, which is used in an example from the present invention present sequence represents a human BAX chimeric phosphorothioate

Sequence 20 BP; 2 A; 8 C; 7 G; 3 T; 0 U; 0 Other;

The present invention describes a compound (1) 8-50 nucleobases in length targeted to a nucleic acid molecule encoding BCL2-associated X (BAX) protein, where the compound specifically hybridises with the nucleic acid molecule encoding BAX protein and inhibits the expression of BAX protein. The compound specifically hybridises with at least 8-nucleobase portion of an active site on a nucleic acid molecule encoding BAX protein. Also described: (1) a composition comprising (1) and a pharmaceutical carrier or diluent; (2) inhibiting the expression of BAX protein in cells or tissues comprising of a disease or condition associated with BAX protein an animal having a disease or condition associated with BAX protein is inhibited. (1) has nootropic, neuroprotective. Cantering the ministering to the animal (1) so that expression of BAX protein is anhibited. (1) has nootropic, neuroprotective and canteiparkinsonian, anticonvulsant, opthalmological, antidiabetic and virucide activities, and can be used in antisense therapy, and as a BAX antagonist. The antisense compounds (1) are useful for modulating the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /note= "phosphorothicate linkages; all cytidine residues are 5-methylcytidines"
                              associated with BAX protein, e.g. familial amylotrophic lateral associated with BAX protein, e.g. familial amylotrophic lateral sclerosis, Alzheimer's disease, Parkinson's disease, Hodgkin's disease, cartilage-hair hyperplasia, diabetes-associated ocular disorders or scrapie infection, or a condition that arises from aberrant apoptosis. The compounds are useful as research reagents and in diagnostics. The present sequence represents a mouse BAX chimeric phosphorothicate oligonucleotide, which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; major histocompatibility complex class II transactivator;

The present invention describes a compound (1) that is 8-50 nucleobases in length: (a) targets a nucleic acid molecule encoding major histocompatibility complex (MHC) class II transactivator, and inhibits the expression of MHC class II transactivator, and inhibits the expression of MHC class II transactivator, or (b) specifically hybridises with at least an 8-cc transactivator; or (b) specifically hybridises with at least an 8-cc mucleobase portion of an active site on a nucleic acid molecule encoding MHC class II transactivator. (I) has immunosuppressive, antimicrobial, antidiabetic, antirheumatic, antiarthritic, cytostatic, notropic, antidiabetic, antirheumatic, mutarthritic, cytostatic, notropic, antisense oligonucleotides can be used for treating an animal having a classas or condition associated with MHC class II transactivator e.g. autoimmune disorder or infection. The antisense oligonucleotides can be used for treating an animal having a collise or tissues. In particular, these diseases include transplant cells or tissues. In particular, these diseases include transplant cells or tissues. In particular, these diseases include transplant cells or tissues. In particular, these diseases include transplant cells or tissues. In particular, these diseases include transplant cells antisense compounds are useful for diagnostics, prophylaxis, or as unitable or used to the present animan MHC class II transactivator chimeric phosphorothioate antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, G protein-coupled receptor; hyperproliferative disorder; GPR37L1; endothelin type b receptor-like protein-2; cerebral vascular disease; antisense; endothelin-binding receptor-like protein-2; atherosclerosis; cardiovascular disease; ETRR-LD-2; G-protein coupled receptor 37 like is acute proliferative nephropathy; ETBR-like protein 2; cancer; stroke;

The invention relates to antisense compounds targetted to the nucleic acid encoding the G protein-coupled receptor ETBR-LP-2 (endothelin type b receptor-like protein-2) to inhibit its expression. ETBR-LP-2 is also known as endothelin-binding receptor-like protein-2, ETBR-like protein 2 and G-protein coupled receptor 37 like 1 (GPR37L1). Antisense compounds of the invention are useful for treating hyperproliferative disorders (especially cancer) and cardiovascular diseases especially angiogenesis, atherosclerosis, hypertension, cerebral vascular disease, stroke and acute proliferative nephropathy. The present sequence is an antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; G protein-coupled receptor; hyperproliferative disorder; GPR37L1; endothelin type b receptor-like protein-2; cerebral vascular disease; antisense; endothelin-binding receptor-like protein-2; atheroselerosis; cardiovascular disease; ETBR-LP-2; G-protein coupled receptor 37 like 1; acute proliferative nephropathy; ETBR-like protein 2; cancer; stroke; angiogenesis; hypertension; phosphorothioate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /mod_base= OTHER

The invention relates to antisense compounds targetted to the nucleic acid encoding the G protein-coupled receptor ETBR-LP-2 (endothelin type b receptor-like protein-2) to inhibit its axpression. ETBR-LP-2 is also known as endothelin-binding receptor-like protein-2. ETBR-like protein 2 and G-protein coupled receptor 37 like 1 (GPR37LL). Antisense compounds of the invention are useful for treating hyperproliferative disorders (especially cancer) and cardiovascular diseases especially angiogenesis, atherosclerosis, hypertension, cerebral vascular disease, stroke and acute proliferative nephropathy. The present sequence is an antisense
                                                                                                                                                                                                                                                                                                 New oligonucleotides which bind the nucleic acid encoding the G protein coupled receptor ETBR-LP-2 (endothelin type b receptor-like protein-z receptor), useful for treating e.g. cancer and cardiovascular diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                acute proliferative nephropathy. The present sequence is an antisense oligonucleotide targetted to human ETBR-LP-2 DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Immunostimulatory, antiinflammatory; dermatological; antipsoriatic; antiulcer; gene therapy; vaccine; non-allergic inflammatory disease; psoriasis; eczema; allergic contact dermatitis; latex dermatitis; inflammatory bowel disease; ulcerative colitis; Crohn's disease; ss.

The invention discloses isolated polynucleotides comprising mouse HYPLIPI CDMs sequence, mouse HYPLIPI genomic DNA, or the homologous human considered mouse HYPLIPI genomic DNA, or the homologous human is associated with a lipid disorder. Also claimed is an expense, or a variant form of a fully defined human FCHLI amino caid sequence, or a variant form of a fully defined human FCHLI amino acid sequence, where the variant is associated with the lipid disorder, an isolated polynucleotide having at least 12 contiguous nucleotides of the isolated polynucleotides, where the 12 contiguous nucleotides of the variation position, an isolated polypeptides, on the variation position, a solated polypeptides comprising 4 contiguous camino acids span the variation position, a kit for the detection of the FCHLI cous comprising, an isolated antibody, identifying susceptibility to a closus comprising, an isolated antibody, identifying susceptibility to a closus comprising, an isolated antibody, identifying susceptibility to a closus comprising, an isolated antibody, identifying susceptibility to a closus comprision of FCHLI nucleotide sequence, where the difference between the suspected allele and the wild-type sequence content for the difference between the suspected allele and a method for screening drugs for inhibition or restoration of FCHLI nucleotide sequence and a carries an altered HYPLIPI or FCHLI allele and a method for screening drugs for inhibition or restoration of FCHLI gene function as an anticourd drugs for inhibition or restoration of FCHLI gene function as an anticourding disorder associated with expression of FCHLI for diagnosis or prognosis of predisposition to lipid disorder, and cancer and for treating a lipid disorder such as familial combined hyperlipidaemia, hyperriphamia, hyperriph
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cancer. The sequence presented is a PCR primer which was used to amplify
                                                              Novel isolated polynucleotide comprising a mouse or human familial combined hyperlipidemia 1 gene having a variation that is associated a lipid disorder, useful for identifying susceptibility to the lipid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              hyperapobetalipoproteinaemia, hypertrigfyceridaemia, low density lipoprotein (LDL) subclass B, familial dyslipidemic hypertension, syndrome X, hypercholesterolaemia, obesity, insulin resistance and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Embryonic stem cell; ES cell; mouse; differentiation; nerve cell;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                          The invention describes a method of treating non-allergic inflammatory disease comprising administering to a subject having or at risk of developing a non-allergic inflammatory disease an immunostimulatory nucleic acid for prevention or treatment of the disease. The method is useful for treating non-allergic inflammatory diseases, such as psoriasis, eczema, allergic context dermatitis, latex dermatitis or inflammatory bowel disease e.g., ulcerative colitis or Crohn's disease. This sequence represents an immunostimulatory nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mouse, PCR; primer, ss; HYPLIP1; FCHL1; variation; lipid disorder; allele; anti-lipid disorder; anti-cancer therapy; gene therapy; familial combined hyperlipidaemia; coronary artery disease; atherogenic lipoprotein phenotype; hyperapobetalipoproteinaemia; hypertriglyceridaemia; low density lipoprotein subclass B; LDL; familial dyslipidemic hypertension; syndrome X; hypercholesterolaemia; obesity; insulin resistance; cancer; cytostatic; antilipaemic;
                                                                                                                                                       Treating non-allergic inflammatory diseases, such as psoriasis, eczema, allergic contact dermatitis, latex dermatitis or inflammatory bowel disease by administering an immunostimulatory nucleic acid.

```
mammalian embryonic stem cells into functioning cells, which comprises
culturing embryonic stem cells in a medium comprising leukaemia inhibitor
culturing embryonic stem cells in a medium comprising leukaemia inhibitor
culturing embryonic stem cells in a medium comprising leukaemia inhibitor
culturing embryonic stem cells. The method
is useful for inducing differentiation of mammalian embryonic stem cells. The method
into functioning cells. Other methods are useful for treating a mammalian
patient having disorders in pancreatic function, and in nerve function.
The cells are pancreatic islet like cell clusters and nerve like cells.
The cells are pancreatic islet like cell clusters and nerve like cells.
The cells are bancreatic islet like cell clusters and nerve like cells.
The cells are used for treating disorders in pancreatic islet function
(e.g. diabetes), neuronal degeneration (e.g. Alzheimer's disease and
Creutzfeldt Jakob disease) or spinal cord disorders. The functioning
cells are useful not only for cell transplant therapy, but for in vitro
screening of various new drugs which affect or restore islet or nerve
function, and for safety evaluation of new drugs. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                        present invention relates to a method of inducing differentiation of

Comparing a consistency are all all and a consistency described by the method above and a DNA high-density microarray comprising a substrate upon which are deposited an array of biosites of genomic DNA fragments having the sequence of at least one exon, and absent polyadenine and vector sequence, where the genomic DNA fragments have a sequence length of from about 75-2000 nucleotides. The method is efficient for amplifying gene sequences, enables large-scale production of gDNA sequences, generates a large quantities of gDNA probes, which enables greater efficiency for printing in microarray formats, fabricates high-density DNA arrays of printing in microarray formats, fabricates high-density DNA arrays of chanced, widely varying genetic content and abstains from using RNA-derived sequences by simple PCR amplifications without cloning. The method produces amplified sequences that have greater specificity and size consistency than that observed with cDNA fragments, and allows for it ment a signal sensitivity than oligonucleotides. The sequence presented of a gDNA sequence, designing probe, performing PCR, separating the product by size differentiation and performing a second PCR to amplify the predetermined sequence. Also claimed is a biological analysis device, comprising a substrate and an array of a set of expressed genetic Amplifying expressed genetic sequences from genomic DNA of mammalian or higher order plant species for printing on DNA microarrays, involves using the 3' untranslated region of the gene sequence. (UTR) The invention discloses a method for amplifying expressed genetic sequences from genomic DNA (gDNA) from mammalian or higher order plant species. The method involves identifying a 3' untranslated region (UTR Disclosure; Page 8; 15pp; English. s a Type II gene specific primer

The invention discloses a polynucleotide comprising a sequence selected from 1970 fully defined nucleotide sequences which encode novel polypeptides. Also claimed is a polypeptide encoded by the polynucleotide or its partial peptide, an antibody binding to the polypeptide or peptide of the polynucleotide, immunologically assaying the polypeptide or peptide peptide of the polynucleotide by contacting the polypeptide or peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Otsuki T, Wakamatsu A, Sato H, Ishii S;

                                                                                                                                                               The invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-G nucleic acid in an aerosol formulation. The methods and compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
                                                 Treating and/or preventing allergy or asthma using an immunostimulatory nucleic acid alone or in combination with an asthma/allergy medicament.
                                                                                                                                                                                                                                                                                                                                                                    Score 13.6; DB 1; Length 20; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          à
                                                                                                                                                                                                                                                                                                                                                 The invention describes an isolated polypeptide (1) comprising a variant form of a mouse HYPLIPI polypeptide sequence (S1) or a human PCHLI polypeptide sequence (S2), not given in the specification, where the variant form is associated with cancer, or an amino acid sequence having at least 65 % sequence identify to (S1) or (S2). A composition comprising at least 65 % sequence identify to (S1) or (S2). A composition comprising or preventing cancer associated but encoding (I) is useful for treating or preventing cancer associated useful for the study of metabolic pathway and cellular mechanism to useful for the study of metabolic pathway and cellular mechanism to identify other genes, receptors and relationships that contribute to identify other genes, receptors and relationships that contribute to the treatment of inpid disorder or cancerous cells. The sequence the treatment of lipid disorder or cancerous cells. The sequence of variation of FCHLI gene or HYPLIPI gene is also useful in the diagnosis of predisposition to lipid disorder and cancer. Antisense polymucleotide sequences are useful in preventing or diminishing the expression of HYPLIPI or FCHLI locus. This sequence represents a primer useful in the analysis of the mouse HYPLIPI gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                               Novel human FCHLI or mouse HYPLIPI polypeptide, useful for drug screening, peptide therapy of lipid disorder or cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 .

with the antibody of the encoded protein, and observing the binding between the two, a transformant carrying the polynucleotide in an expressible manner and an antisense polynucleotide. The oligonucleotide is useful as a primer for synthesising the polynucleotide, or as a probe for detecting the polynucleotide. The polynucleotide or as a probe for detecting the polynucleotide. The polynucleotide or as a probe genes may be included in them, for developing a diagnostic marker or medicines for regulation of their expression and activity, or as targets of gene therapy. The genes are involved in tissue and/or cell regeneration. Membrane proteins, disease-related proteins and genes concoding them can be used as indicators for diseases (e.g. osteoporosis, neurological diseases, cancer, tumours. The CDNA may be used to regulate the activity or expression of the encoded protein to treat diseases. The expression analysis of the genes of the invention. Note: Some of the expression, but is based on sequence information supplied by the

New compound having a sequence targeted to a nucleic acid encoding Transforming growth factor beta-receptor II, useful for preparing a composition for treating hyperproliferative disorder e.g., lung, liver, colon or gastric cancer

Claim 3; SEQ ID NO 103; 141pp; English.

The invention comprises antisense oligonucleotides that are targeted to the nucleic acid encoding transforming growth factor beta (TGF-beta) receptor II. The antisense oligonucleotides of the invention are useful

```
ö
for treating: hyperproliferative disorders (e.g. breast cancer), or an autoimmune disorder (e.g. rheumatoid arthritis). The present DNA sequence represents a 2'-O-methoxyethyl gapmer oligonucleotide with a phosphorothioate backbone that is targeted to mouse TGF-beta receptor II.

Inhibiting corneal allograft rejection, by contacting an allograft with a formulation having an oligonuclectide targeted to intercellular adhesion molecule-1, extracellular adhesion molecule-1 or vascular cell adhesion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a method of inhibiting corneal allograft rejection, by contacting the allograft with a topical formulation comprising an antisense oligonucleotide targeted to intercellular adhesion molecule-1 (ICAM-1), extracellular adhesion molecule-1 (ELAM-1) or vascular cell adhesion molecule-1 (VCAM-1). The oligonucleotide is useful for inhibiting corneal allograft rejection or for preserving a corneal explant ex vivo, where the explant is human. This sequence corresponds to one of the oligonucleotide of the invention.
